Therapeutic Equivalence Ratings

Drug products the FDA considers therapeutically equivalent to other pharmaceutically equivalent products. These codes are published in FDA's Orange Book:	
AA	Products in conventional dosage forms not presenting bioequivalence problems
AB	Products meeting necessary bioequivalence requirements
AB1	Products meeting necessary bioequivalence requirements, assigned when more than one reference listed drug of the same strength has been designated under the same heading
AB2	Products meeting necessary bioequivalence requirements, assigned when more than one reference listed drug of the same strength has been designated under the same heading
AB3	Products meeting necessary bioequivalence requirements, assigned when more than one reference listed drug of the same strength has been designated under the same heading
AB4	Products meeting necessary bioequivalence requirements, assigned when more than one reference listed drug of the same strength has been designated under the same heading
AN	Solutions and powders for aerosolization
AO	Injectable oil solutions
AP	Injectable aqueous solutions and, in certain instances, intravenous non-aqueous solutions
AT	Topical products
BD	Products containing active ingredients with known bioequivalence problems and for which adequate studies have not been submitted to FDA demonstrating bioequivalence

Latex Content

The term "natural rubber" includes all materials made from or containing natural latex. Products containing natural rubber are made using two commonly employed manufacturing processes: the natural rubber latex (NRL) process, and the dry natural rubber (DNR) process.

"Natural latex" is defined as a milky fluid that consists of extremely small particles of rubber obtained from plants, principally from the *H. brasiliensis* (rubber) tree, dispersed in an aqueous medium. It contains a variety of naturally occurring substances including cis-1,4-polyisoprene in a colloidal suspension and plant proteins, which are believed to be the primary allergen.

The NRL manufacturing process involves the use of natural latex in a concentrated colloidal suspension. Products are formed from natural rubber latex by dipping, extruding, or coating, and are typically referred to as containing or made of "natural rubber latex."

The DNR manufacturing process involves the use of coagulated natural latex in the form of dried or milled sheets. Products are formed from dry natural rubber by compression molding, extrusion, or by converting the sheets into a solution for dipping. These products are typically referred to as containing or made of dry natural rubber or "crepe" rubber. Examples of products that may contain dry natural rubber include syringe plungers, vial stoppers and injection ports on intra-vascular tubing.

For more information from the FDA about natural rubber, please visit www.fda.gov/RegulatoryInformation/Guidances/ucm070925.htm.

Based on the information provided by our suppliers, the product listing in this brochure will relate to a specific component of the medical product, its container, or any packaging.

Should you have additional questions, please feel free to contact Teva at 888.838.2872.

The icons below are used throughout the product sections to identify key product attributes.

Indicates products that are preservative free, minimizing the risk of side effects and allergic reactions.

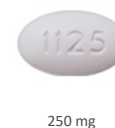

Identifies unit dose products and injectable products labeled with a scannable standard code 128 bar code or a scannable standard RSS bar code. Each bar code contains the NDC number for a single tablet, capsule, or a single vial. This feature helps ensure accuracy and patient safety when dispensing, and facilitates order entry and inventory maintenance.
